

KAMI

v2.0 Parchment

Nine templates, four languages, one constraint set, every output ready to ship.

2026.06.14

Changelog

Breaking Changes

1. **BREAKING** Template registry moved to `scripts/shared.py`. Custom forks that patched `build.py` directly must re-point at the new `HTML_TEMPLATES` map.
2. **BREAKING** Commercial CJK fonts are no longer bundled in `dist/kami.zip`. Run `scripts/ensure-fonts.sh` once to restore local preview paths.

Features

1. Added the `Landing Page` template with five deployment companions (vercel, sitemap, robots, llms, llms-full).
2. Slides now ship three rendering paths: WeasyPrint HTML to PDF, editable PPTX via `python-pptx`, and a Markdown-first Marp variant.
3. Pygments syntax highlighting for code blocks, with a clean monochrome fallback when it is not installed.
4. Resume gained a `dense` variant that keeps five-plus project entries inside a strict two-page bound.

Fixes

1. Tightened resume project spacing so company blocks no longer crowd against each other on page one.
2. Resolved CJK parenthesis wrapping that broke line rhythm in Chinese and Korean templates.
3. Cross-template token drift is now caught by `build.py --check` before packaging.

ACKNOWLEDGEMENTS

Built on WeasyPrint, Tauri, and the TsangerJinKai, Charter, and YuMincho type families. Thanks to everyone who filed visual-QA issues across the CJK rendering paths.
