

Turn any webpage into a desktop app

Pake packages a URL into a fast, native-feeling app, in one command.

v3.0

38K+ GitHub stars

40× smaller than
Electron

3 platforms shipped

<10s to package an
app

Electron ships a whole browser with every app. Pake takes the opposite bet: lean on the system webview and write the shell in Rust, so the same web app becomes a desktop build that is **roughly 40× smaller** and starts in well under a second.

Why Pake

Most "wrap my site as an app" tools trade size and speed for convenience. Pake refuses the trade.

- Bundles around **5 MB**, against 100 MB+ for an equivalent Electron build.
- Native shortcuts, immersive window, and ad-blocking baked in.
- One CLI command, or a no-code GitHub Action, to ship.

How it works

A Tauri + Rust core drives the platform webview directly, with thin per-OS adapters.

- Rust shell handles windows, tray, and injection.
- System webview renders the page, no Chromium copy.
- One config maps URL, icon, and shortcuts to a build.

Roadmap where the project is heading

PHASE 1

One-command packaging

CLI turns any URL into macOS, Windows, and Linux builds.

PHASE 2

No-code pipeline

GitHub Action builds apps without a local toolchain.

PHASE 3

Deeper native bridge

Richer JS-to-system APIs while keeping the footprint tiny.

The web already is the cross-platform runtime. Pake just removes the 95 MB of browser you were shipping to use it.
